Meeting reports - Group 11

Week 1 - Monday 19.10.2026

Idea: Some sort of software that eases the administrative burden on prisons in Hamar.
Problem it solves: Understaffed prisons in Hamar.
Why is this a plausible idea?: Hamar's prison is understaffed. Making this software can thus alleviate parts of the burden for employees, thus allowing them to delegate their efforts on other core tasks.
Why was it dropped?: Difficult to get information on what sort of solution would benefit the prisons. Prison closing in less than 2 years in favour of a new, larger complex in Ilseng, Stange.

Week 1 - Thursday 22.10.2026

Idea: Some sort of app that helps connect volunteer organisations with the elderly
Problem it solves: There are a lot of elderly people in Hamar and Norway in general, that could use help with many different task from volunteers. We aim to streamline the process.
Why is it a plausible idea?: Most elderly are either institutionalized or choose to stay at home, with most choosing to stay at home. Those who have legitimate medical needs recieve the minimal necessary care from state institutions to maintain their health, but secondary tasks are often left to volunteers or family members, but this process of organizing volunteer action can be tedious, and as such we aim to make a software that streamlines this process and makes it easier for the elderly/their family to get in touch with volunteers and prescribe/order help for them on a by-need basis.
Why was it dropped?: This idea would either require us to gather personal information on the users, or get access to a private database, neither of which is acceptable for the exam.

Week 2 - Monday 26.10.2026

Idea: An agentic workflow that aggregates, validates and categorizes youth events in Hamar from official feeds, APIs and organizer submissions, and publishes them as a filterable calendar, subscribable feeds and a weekly digest.

Problem it solves: Lowers the barrier to finding social activities in the Hamar area. Hamar municipality has reported concerns regarding a youth loneliness epidemic. Lowering the threshold for finding activities with others in the region, can help alleviate the issue in the long run.
Why is it a plausible idea?: This idea requires no personal data whatsoever, and our agent can collect information from publicly available sources whilst still respecting said sources. It fits within the constraints of the exam, while also solving the problem of not easily being able to find activities in Hamar. The nature of this harness will make it easier to collect, extract, validate, and classify data in the project compared to previous ideas.
Why was it dropped?: Idea was kept.

Week 2 - Wednesday 28.10.2026

We dropped our current API source (Ticketmaster in favour of a local, Norwegian source (Kulturnett Innlandet), though we are still waiting for access if possible at all. If not, then we may make a solution that runs on synthetic data, as the task is to make a solution that exists and runs, and not a finished product. We also finalized most, if not all of the initial skeleton for the model harness.

Week 2 - Thursday 29.10.2026

We made our own synthetic data that didn't perfectly match the model's expected inputs. This was on purpose to test how robust the model was. We discovered that the model was overfitted quite heavily, and didn't really respond well to our tests. The code which filters outright rejections and duplicates worked perfectly. We also wrote the report required for the second compulsory task and converted it into the LaTeX format.
